

Hooray, a Telemachus company

A plan to take Moonpig's market with the data it isn't using

Akshay Devon · 18 September 2026

Summary

Moonpig makes £51.7m of profit after tax and converts 13% of the 113 million occasions it knows about. It sends a reminder. Nine times in ten, nothing happens.

Hooray drafts the card first and asks second. It sells to companies, where one signature brings hundreds of occasions and the cost is an operator's time, not an advertising budget. Then it reaches consumers through the people who work there.

The pitch to a firm. £30 per employee per year. Every person noticed on every occasion, nobody has to remember anything, and each employee gets six cards a year for their own family. At Moonpig's prices that's £8,500 of card value for £6,000, before the automation.

The moat. The list of people and dates. Everything else is replicable. Companies are the door because a signature is the cheapest way to put the consumer product in front of hundreds of people who'll build that list.

The inefficiency is in the data. Fifteen years of orders tell it who sends to whom, where they live, what they wrote and when. It uses that to send an email. It doesn't infer next year's occasion from this year's card, doesn't see that two customers with the same mother are siblings, doesn't convert the 36 million people who receive a card each year. Hooray does all of that from day one.

This is not a UK-only plan. Print is bought wherever the card lands, so a card to a mother in Mumbai is printed in Mumbai. The consumer product serves every country a print partner covers from the first day, and the company product enters the US, four times the UK with no online leader, through the same door.

The aim is Moonpig's market. A quarter of its UK revenue by year five is about 1.8 million consumers. The financials get to 300,000 by year three, seeded by employers in year one and grown by the product's own loops from year two, with the consumer line overtaking the company line in year four.

Built today. The whole loop, running: roster in, cards drafted, the weekly digest emailed through Brevo, the print request to Stannp on a key I got by phone this afternoon, collections that open themselves when someone leaves, gifts on milestones, a consent gate, a personal workspace.

The ask. £250k of capital over twelve months. One person to start, a second at day ninety, salaries carried by Telemachus. Three hundred accounts, 25,000 consumers, £2.55m of revenue, contribution-positive on operating costs by month nine. Gates at thirty, sixty and ninety days.

1. Moonpig

The numbers

	FY26
Revenue	£373.0m; UK cards £284.5m
Gross margin, Moonpig segment	55.9%
Adjusted EBITDA	£104.6m, 28%
Profit after tax	£51.7m
Free cash flow	£73.5m; about £65m returned to shareholders
Marketing	£38.7m, 10.4% of revenue
Shipping and logistics	£88.2m, 23.6% of revenue, growing faster than sales
Customers, orders, order value	12.3m, 36m, £9.32
Reminders held	113m
Employees	676; 143 in operations
Revenue per employee	£552k

Five times the Telemachus profit threshold. Half the revenue-per-employee bar. No serious challenger.

Where it falls short

- 87% of reminders produce nothing.** 9.2 held per customer, 2.92 orders, about 1.2 of them prompted. The chief executive: most customers use Moonpig for a small proportion of the occasions they celebrate. Their own figure is 18%.
- Marketing costs a customer's whole first year.** £38.7m against £39.5m of new-customer revenue. The base grew 2.8%.
- Growth is price, not demand.** Orders down 9.5% since FY22. Order value up 21%.
- Shipping is eating the margin.** Up 9.4% against revenue up 6.5%. Over 40% of card-only orders now pay for tracked delivery, because they were ordered late, because the reminder didn't work.

5. Gifts are 39% of revenue on an 18% attach rate that moves 0.2 points a year.

What it does with its data

For 36 million orders a year Moonpig knows the sender, the recipient and their address, the relationship, the occasion, the design, the message inside, the gift, the price, and how many days early it came. Fifteen years of that is millions of real messages and a map of where 100 million people live and who loves them.

It sends a reminder email seven days out. It doesn't:

- Infer that a card to Sarah every May means May is Sarah's birthday
- Notice that two customers sending to the same "Mum" at the same address are siblings
- Do anything deliberate with the 36 million people who receive a card each year
- Draft your message from the twelve you've already written
- Stop reminding you about someone after you've sent a sympathy card

That's the inefficiency. Not the factory. The data.

The 533 people

Only 143 of 676 staff work in operations, and the factory is lean. The rest: an engineering organisation capitalising £11.8m of software a year, a marketing function spending £38.7m, merchandisers for thousands of designs, customer service, and separate organisations for Greetz and the experiences business. Necessary for a catalogue-and-brand model. In ours, designs are generated, acquisition is a contract, and the editor is an email. Four functions survive: engineering, an operator, supply, compliance.

The experiences business

Buyagift and Red Letter Days. A voucher agency reporting 93.8% gross margin because it books commission, not face value. Written down £56.7m in FY25, revenue down 4.5%. Not worth replicating; experience vouchers are already one option when a collection closes.

Why it won, and why that advantage has ended

Founded June 2000. Printed from Guernsey, where cards under £15 shipped VAT-free until April 2012: twelve years of a 20% price edge while it built the brand and the list. Funky Pigeon was building its own Guernsey facility when the relief closed.

What won it	Now
First mover	Category built
Twelve years VAT-free	Closed by law
Television	Costs £38.7m a year to hold
The list	Converts at 13%
Own factories, same-day dispatch	Only matters if the card is late
Bought Greetz	Needs £73.5m of cash flow

The window shut in 2012. This year's annual report lists "agentic AI disintermediation" as a principal risk while the chief executive calls AI "an enabler within our model, rather than a structural change." Both can't be true.

2. Hooray

Moonpig sells at the reminder. We sell at the contract.

For companies

Connect the HR system once. The calendar builds itself. Ten days before each occasion a card exists, in the firm's voice, signed by the right manager. One email a week: approve, change a line, or hold. Do nothing and it goes anyway at five days. The product demonstrates effort without anyone expending it.

Collections open on the occasions people give for: 78% for a leaver, 75% for a retirement, 22% for a routine birthday. Team-scoped, private contributions, recipient chooses the gift. The leaver collection exists nowhere else, because nobody can schedule a resignation ninety days out.

Milestones and client dates carry a company-paid gift, set by policy once. Quality is visible: the recipient sits three desks away.

For people

Same loop, your own life. Import birthdays from Google or Microsoft contacts in one consent. Apple only allows contact-by-contact. Facebook closed friends' data to apps in 2018, so the import is from contact books, not social networks. What does work socially is a share link, "tell me your birthday": each person adds their own date, and every reply is a lead.

Ten days out, one email: Mum's birthday is in ten days, here's the card. Send, edit, or skip. Nothing goes without the tap unless you subscribe.

Tier	Price	Covers
Free	£0	Two cards a year; six through an employer
Circle	£29 a year	Eight cards, sent automatically
More	£3.99 a card	Beyond the plan, posted

Annual, because occasions are annual. Moonpig Plus has 1.2 million subscribers at £10.99 a year, so people pay for a card subscription and the entry price should be low. Cash upfront, one decision a year.

What it does not do is same-day rescue. That remains Moonpig's strength.

Why people want this

- UK office workers spend £1,715 a year on office occasions
- The average collection is £138 from twelve people
- 89% find organising one hard; 65% don't know how much to give; 72% would rather choose their own gift
- Firms pay £72 to £96 a head for perks platforms that only work if staff log in
- Moonpig for Business already has Salesforce and Gousto
- Print.one connects HR systems to printed cards in the Netherlands, with customers

We are not creating demand. People already spend, collect and subscribe, and do so inconsistently. We organise it, and the first ten pilots convert in month one.

3. The moat

The list. Print, design, drafting, the digest: anyone can build them. Nobody can build 113 million occasions quickly. This is a plan to build a list faster and cheaper than Moonpig did.

Route	Yield	Cost per occasion
Paid consumer acquisition	9 occasions per person	£5; doesn't pay back
Company roster	200 work occasions per signature	An operator's time
Roster plus allowance	200 people who now add their family	Same signature
Contact import	10 to 20 per person	Nothing
Circle request	Every reply	Nothing, compounding

Companies are the door because the signature pays the salaries and the allowance builds the list. Three consequences: the consumer product opens on day one; import and circle are in the first thirty days; the headline metric is personal occasions under management.

Scale: employers seed 18,000 consumers in year one; the loops take it to 25,000 and 225,000 occasions. By year three it's 300,000 consumers and four million occasions, 3.5% of Moonpig's list, converting better because the card is drafted, not reminded.

How the list grows without data entry

Moonpig has the data for each of these. It does none.

1. **Every card creates the next occasion.** A birthday card makes next year's date. A wedding card makes an anniversary. A baby card makes a birthday for a person no contact book has. A sympathy card stops the reminders.
2. **The graph, not the list.** You and your brother both send to the same "Mum": the graph knows you're siblings and offers you his birthday, and one family card to her.
3. **The recipient is the next customer.** A code on every card: send one back, sender pre-filled. Thirty-six million cards a year reach a doormat, and Moonpig prints a logo on the back.
4. **Drafts learn from what you write.** By the fourth card to your mother it sounds like you. One office manager's edits teach the whole firm.
5. **Infer, don't ask.** Import, ask the circle, read last year's card. A list that's mostly inferred.
6. **Learn the real list.** Skip the same cousin three years and we stop drafting for the cousin.
7. **Attach where people spend.** A 40th, a 25th anniversary, a first Mother's Day. Not 18% flat.
8. **The address book.** Every reply is an address. Nobody else knows where people's mothers live.

Items one and three are cheap and go into the first ninety days.

4. The market

UK cards: £1.51bn a year. That's single-card retail sales. Moonpig's UK card revenue is about £203m of it, 13%, from 12.3 million customers. The other 87% is high street and supermarket, which is where the customer who forgot goes on the day. The category isn't growing on volume and doesn't need to.

UK companies. 38,435 firms with 50 to 249 staff employing 3.5 million people. £105m of seats if every one bought. With larger firms and client rosters, around £200m. Year one at 300 accounts is 0.8% of the core band.

Relationship businesses. Banks, wealth managers, brokers, property, partner-led firms. Each relationship manager holds 50 to 200 clients. A card on the client's birthday or deal anniversary, signed by the person they know, is what a good manager does when they remember. A bank with 500 managers is 50,000 contacts under one signature. Cards need no sign-off; gifts follow the hospitality policy, and every one is logged.

International: our model travels. Moonpig's didn't. In twenty-five years Moonpig built one meaningful market outside the UK, Greetz in the Netherlands at £51m, and it bought that. Its model needs a factory and a television brand in every country it enters. Ours needs neither. Print is bought from a local partner wherever the card lands, and acquisition is a roster, which reads the same in any language.

Market	Size	Why it works
Netherlands	Greetz, £51m	Consumer demand proven; a Dutch HR-to-print product proves the company buyer
United States	\$7.1bn, four times the UK	Hallmark and American Greetings hold 70% through shops. No online leader. Same door: firms
Ireland, Australia	Moonpig already ships to Australia via third parties	Demand exists; the print partners are there

The diaspora. People have family everywhere. A card to a mother in Mumbai or a brother in Sydney is the occasion people most regret missing, and Moonpig posts it from Guernsey. We print it in Mumbai. The print-on-demand networks already have partners in more than thirty countries; a card to family abroad costs what one across town costs and arrives on the day. From the first day the consumer product serves every country a print partner covers, which makes the UK a launch market rather than the market.

5. Economics

Price. £30 per employee per year. Client rosters £0.50 per contact plus £3.60 a card, matching Moonpig's business price. We could survive a price war at 61% card margin; they can't go below their own consumer price.

Cost. £1.39 a card all in through Docmail, envelope and second-class post included. Stannp £1.15, no envelope, prototype only. I rang Stannp at four; they set up a free API trial on the call and the key was live by five. Moonpig's card costs less than ours by thirty to sixty pence. We don't compete on card cost. Print is £2.78 of a £30 seat. Card cost could double and the seat clears 70%.

A 200-person firm, staff only

	Revenue	Cost	Gross profit
200 seats	£6,000	£1,343	£4,657
37 collections, 11% blended take	£597		£597
	£6,597	£1,343	£5,254 · 80%

Assumes 40% use the allowance. At 100%, margin holds at 63%.

With 2,000 client contacts added

	Revenue	Cost	Gross profit
Platform, cards, 200 gifts at £50	£10,700	£2,880	£7,820 · 73%

Fully expanded: £17,297 revenue, £13,074 gross profit, £15,000 of gift value through it. Collection handling is a 1% to 3% market; the 11% assumes a quarter of pots buy a gift we source at 25% margin.

A consumer account. About £23 revenue, £18 gross profit a year. Roughly a Moonpig customer before the £3.15 a head Moonpig spends keeping them. Not a richer customer. A free one.

Supply. Print bought, not built; a press is a year-three question. Gifts never held; Moonpig carries £8.7m of stock. Seats paid a year upfront, so no supplier terms needed; Moonpig runs on 134-day payables. Royal Mail rises hit both of us.

6. Go-to-market

Start

UK professional services, 50 to 250 staff, with a CRM. London. Clean HR data, a client roster to expand into, a partner who currently writes the leaving card personally, and a £6,000 ticket under the procurement line.

Not firms over a thousand, under twenty, or in retail and hospitality. The exception is relationship businesses, where a bank or broker's size is the size of the prize. Quarter three, with references.

The first fifty

The product sends cards. The first customers come from using it to send cards.

1. **The Telemachus network.** Its portfolio, its investors, its founders' contacts at firms of the right size. The first ten come from warm introductions, not from selling inside the building.
2. **A card, not an email, to the next hundred.** A hundred Heads of People at London firms of the right size. LinkedIn gives their start date. On their work anniversary, a real card lands on their desk, drafted by the system, signed by me, with one line on the back: your staff would get one of these on every occasion, and nobody at Hooray typed this. A hundred cards is £139. It's the demo, delivered.
3. **One free leaving collection.** The office manager is dreading next month's envelope. Run that one, no commitment. Eight colleagues sign, the leaver posts it, the Head of People sees the product at its best. Then ask about the roster.

4. **Where the champions already are.** Office managers and executive assistants have their own communities, thousands strong, all doing this by hand. One honest post.
5. **The open offer.** A public offer to run any firm's next leaving card free for a month. Every collection page reaches a whole team; every leaver shares it. The shared-card loop, triggered on purpose, at a pound a time.

Who signs

Roster	Buyer	Budget	The line
Staff	Head of People	Benefits	Every person noticed, every time, and a benefit they'll use
Clients	Managing Partner or Head of BD	Client entertainment	Every client, every milestone, without you remembering
Either, under 150 staff	Founder	Discretionary	Your name on every card, and you never think about it

The champion is the office manager who does it by hand. Ask how, then ask who signs. Never pitch saved hours; £6,000 doesn't beat a hundred hours. Never say cheaper than Moonpig.

The sale

1. Twenty-minute call
2. Ten-minute onboarding next day; consent email to staff
3. First digest the following Monday, real cards
4. First month free
5. Convert at day 30 on the approval rate and the first collection
6. Client roster at day 60; gift policy at renewal

Channels

Channel	What	Starts	Cost	Yields
The Telemachus network	Warm introductions from the portfolio and its investors	Week 1	Nothing	The first ten
The hundred cards	A real card on the buyer's work anniversary, drafted by the product	Week 2	£139	Replies at a rate no email gets
One free leaving collection	The collection the office manager would otherwise run by hand	Month 1	£1.39	The product at its best, in front of the buyer
LinkedIn outbound	Heads of People and managing partners, by title and headcount	Month 1	Operator time	Seventy accounts a year on its own
Office manager communities	Facebook groups and Slack workspaces, thousands strong	Month 1	Nothing	The champions, in one place
Circle request	"Tell me your birthday," on WhatsApp or a story	Month 1	Nothing	Every reply is an occasion and a lead
The shared card	Leavers post the card on LinkedIn	Month 3	Nothing	Seven posts per account a year, in front of the next firm
The recipient code	Send one back, sender pre-filled, on every card	Month 3	Print	Every card is a lead
HRIS marketplaces	BambooHR, HiBob, Personio app stores	Month 6	Integration	Inbound from firms already on those systems
Benefits brokers	Resell perks to firms of 50 to 500	Month 6	A margin share	Distribution into the benefits budget
Professional networks	Accountancy, law, recruitment bodies; regional groups	Month 6	Sponsorship	One member's adoption is the next one's reference
Paid retargeting	People who have already received a card	Month 12	Budget, against measured lifetime value	Warm, not cold

Moonpig spends £38.7m a year buying strangers. Every channel above reaches people the product has already touched, or costs nothing.

The funnel

Twenty messages a day, 5% reply, half become pilots, 60% convert: one and a half accounts a week, seventy a year from cold outbound. The target is 300. The gap closes three ways: the Telemachus network and the hundred cards for the first thirty, shared-card inbound from month three, and the second person taking the product at day ninety so the first sells full time. Outbound alone is the floor; the three together are the plan.

Measure: reply rate, pilot rate, conversion, days to close, expansion at day 60, cost per account. Stop at £2,000 an account or six weeks a cycle.

Sequence

Q1 London professional services, ten pilots to thirty paid. Q2 client rosters on every account; second city. Q3 multi-site groups and relationship businesses; partner channels. Q4 the third person on consumer growth; the paid-acquisition decision against a measured cohort.

7. Competition

	Has	Lacks
Moonpig for Business, £3.60	Brand, factory, Salesforce, Gousto	Integration, drafting, collections
Moonpig group cards	50 contributors by link	A pot, a trigger, gift choice
Moonpig Plus, £10.99	1.2m subscribers	Sends nothing; discounts
Thankbox	Digital pots, some HR provisioning	Physical, automation
Reachdesk, Sendoso	HR triggers for gifts	Anything under \$15k a year
Print.one, NL	The closest full stack	English-market connectors, approval
Collection Pot and similar	Pots at 0 to 4.5%	Any trigger

Nothing on either side drafts the card before being asked. I've stayed off feature parity with Moonpig's editor and on the contract, the roster and the collection.

8. Built today

Running, on a simulated clock, in the repository:

- Engine: draft at ten days, dispatch at five, auto-approve the untouched
- Roster import: staff, clients, consent, leave, delivery preference
- Drafting in the firm's voice with the right signer; ten-case eval with wording checks

- Print-ready PDF at trim size; the Stannp request, live on today's key
- Collections on leavers, retirements, weddings, babies, milestones; team-scoped; contributions, signing, gift choice
- Company-paid gifts on milestones and client dates, by policy
- Consent gate; held cards; on-leave flag
- Weekly digest through Brevo, sent live at 15:53
- Personal workspace with the business-and-people switch; per-occasion personal email
- Dashboard on Moonpig's real figures; headless test of a simulated year

Not built: hosting, payments, HR connectors, gift fulfilment, authentication, multi-tenancy, contact import, the circle request. All in section 12.

9. Financials

Two lines, weighted equally. The company line pays for the unit. The consumer line is the business.

Where consumers come from

Active consumer accounts	Year 1	Year 2	Year 3
Employees activating on the allowance, cumulative	18,000	30,000	45,000
Circle request and referral	4,000	30,000	120,000
The recipient code on every card	2,000	15,000	60,000
Diaspora, free tier, organic	1,000	15,000	75,000
Active consumers	25,000	90,000	300,000
Personal occasions on the list	225,000	1.0m	4.0m

Year one is seeded by employers. By year two the loops outgrow the seeding. By year three they're four-fifths of new accounts, which is what compounding looks like when the product grows the list without anyone typing. The loop coefficients behind this, about one new consumer per active consumer per year by year three across circle, code and referral, are the assumption the whole consumer line rests on, and they're measured from month one.

Revenue per active consumer is £18 a year on the annual tiers, blended across free, Circle and pay-as-you-go, with gifts on top. Gross margin 72%.

The unit

	Year 1	Year 2	Year 3
Company accounts	300	500	750
Company revenue	£2.1m	£4.5m	£8.3m
Active consumers	25,000	90,000	300,000
Consumer revenue	£0.45m	£1.6m	£5.4m
Revenue	£2.55m	£6.1m	£13.7m
Gross profit	£2.0m	£4.75m	£10.5m
Operating cost, excluding salaries	£0.25m	£0.45m	£0.7m
Contribution	£1.75m	£4.3m	£9.8m
Headcount	1, then 2	3	5
Salaries, carried by Telemachus	£0.2m	£0.4m	£0.7m
Revenue per head	£1.3m	£2.0m	£2.7m
Consumer share of revenue	18%	26%	39%

Card cost is contracted. The rest is a projection. Revenue per head passes \$1m in year one, because the unit starts with one person and the machine does the execution. Contribution-positive on operating costs around month nine. The consumer line grows three times faster than the company line and overtakes it in year four.

The endgame

Moonpig UK is £284.5m from customers spending £27 a year. A quarter of that is £70m, about 1.8 million consumers at £40 a year, which is more per head than Moonpig gets because we convert more of the occasions we know about. From 300,000 at year three, that's two and a half times a year for two years: year five. The loops in section 3 deliver it. Short of that, this is a profitable business worth tens of millions. At it, every card we send is one Moonpig didn't, and its cost per new customer rises until the model breaks.

10. Team

One person to start. That's how Telemachus runs a unit: an operator who supplies the context and the relationships, and a machine that does the execution. Today is the proof. The engine, the drafting, the digest, the print pipeline, the collections, the consent gate and the dashboard were built by one person in a day, with the tools Telemachus uses.

	From	Owns
The first person	Day one	Sales, the first fifty relationships, print and gift supplier contracts, the etiquette layer (bereavement, leave, who signs for whom), pilot onboarding, and running the machine
The second person	Day ninety, at thirty paying accounts	The product and the consumer loops: connectors, contact import, the circle request, the recipient code, hosting, payments. Takes the machine so the first person sells full time
A third	10,000 active consumers	Consumer growth

Two people run it through year one. Three in year two, five in year three. Revenue per head is above \$1m from the first year, which is the point of the model.

Sources and uses

Salaries are carried by Telemachus and are not in this ask. Uses over twelve months:

Use	£
Hosting, infrastructure, AI inference	35,000
Connector development, tooling, licences	25,000
Print and post float: customers pay annually, print is paid per card	40,000
Gift sourcing float and supplier onboarding	20,000
The hundred-card campaign, the leaving-collection offer, samples	5,000
Legal: data agreements, consent, consumer terms, hospitality policy	15,000
Partner integrations: HRIS marketplaces, benefits brokers	15,000
Travel, events, professional networks	10,000
Paid retargeting test at month twelve, against measured lifetime value	50,000
Contingency	35,000
Total	250,000

Sources: £250,000 from Telemachus. Seats are paid annually upfront, so customer prepayments cover the print and gift floats from the second quarter, and the unit is contribution-positive on operating costs by month nine.

11. Kill criteria

	Status	Stop if
Employees given six free cards add their family	Open. The moat test	Under 15% at month six
A firm pays £30 a head	Open	Cost per account over £2,000, or cycle over six weeks
Drafts approved without editing	Early signal	Under 60% at month three
Leaver collections	Survey says 78%	Under 50% in beta
Accounts expand beyond staff	Open	Under 30% by month nine
Consumers send more than at Moonpig	Open	Under 2.5 a year at month twelve
The loops outgrow the seeding	Open	New consumers from circle, code and referral below employee seeding at month eighteen
A card under £3 all in	Confirmed, £1.39	
Personalisation under £10k	Confirmed today	
Paid consumer acquisition pays back	It doesn't: £45, nine months	
The category must grow	It needn't; orders fell 9.5%	
Read as a cost play	Risk	Any line that leads with "cheaper than Moonpig"
Moonpig ships an HR integration	Risk	Within six months
Royal Mail keeps rising	Risk	A card over £2.50 breaks the consumer per-card tier

12. Ninety days

Fortnight	Product	Sales	Operations	Gate
1	Consumer product open. Google and Microsoft contact import. Every card creates next year's occasion	First introductions from the Telemachus network. The hundred cards posted	Docmail contracted. Stripe Connect live. Hosted, on a real clock	Five customers live
2	Circle request. Consent email as consumer signup. First HR connector	Ten pilots from replies and network	Consent records and data agreements in place	Ten pilots onboarded
3	Second HR connector. Digest edits captured, not yet applied	First leaving collections running at pilots	Support live; first gifts sourced	30% of employees adding personal contacts; 70% of drafts approved unedited
4	Client-roster product. Per-occasion personal email	Pilots converting at day 30	Gift supplier terms signed	Five pilots paid; 20,000 personal occasions
5	Gift sourcing inside the collection flow. Slack and Teams approval	Client rosters attached at day 60	Second print supplier live	Thirty paying; a quarter expanded
6	Recipient code on every card. Referral	Multi-site and relationship-business conversations open	Consumer subscription live	£1m recurring; 50,000 personal occasions; first subscription

Before fortnight one: Docmail, Stripe Connect, one named pilot from my own network.

Held back on purpose: learning from digest edits, until there's a baseline approval rate to measure it against.
